

Knowledge of the nine core competences required for all clinical psychology practice supports the specific digital competences detailed, including:

- Generalisable meta-competencies related to drawing on broad range of psychological knowledge, models and evidence (including practice based evidence) to assess, formulate and intervene psychologically.
- Working reflectively, critically and creatively in different settings and novel situations as well as in complex clinical decision-making without being formulaic in application.
- Working collaboratively with service users and carers, and other relevant stakeholders.
- Making informed judgments on complex issues in specialist fields, often in the absence of complete information.
- Demonstrating self-awareness and sensitivity, and working as a reflective practitioner within ethical and professional practice frameworks.
